# **Application Metadata Intelligence**

Application Metadata Intelligence, Powered by Deep Packet Inspection, Provides Summarized and Context-Aware Information About Raw Packets Based on Layers 4–7

Figure 1. Application Metadata Intelligence extracts metadata elements for use by ecosystem solutions such as SIEM and performance monitoring tools.

### **Key Features**

- Close to 6,000 protocols, applications, and user behaviors L4-7 attributes spanning over 4,000 standard and custom apps
- Identify specific users and link actions such as client login and subsequent file usage by application
- Metadata for 3G/4G LTE and 5G mobile network traffic enriched with subscriber, device and location
- Integration with Gigamon Application Visualization, Application Filtering, and GigaVUE-FM fabric manager solutions
- Use case based application and attribute templates for metadata extraction
- Export metadata in IPFIX, CEF and JSON over HTTP/S and Kafka
- GigaVUE Enriched Metadata (GEM) for Cloud Workloads delivers high-value, lightweight metadata enriched with cloud-native context—enabling faster detection, investigation, and response without the overhead of full packet capture.

### **Key Benefits**

- Increase network performance and uptime by identifying bottleneck and outage details
- Support investigators hunting threats and breaches from shadow IT and file-sharing sites
- Secure communication links by observing broad Layer 7 metadata to prevent malicious commands
- Simplify tool deployment for both on-prem or cloud-hosted scenarios, including SIEM, network, and performance monitoring
- Assist tools to ensure resource security by viewing and blocking actions such as social media users and requested file/video names
- Easily monitor 3G/4G and 5G mobile networks with 99% data volume reduction in network traffic by using GigaVUE Enriched Metadata for Mobile Networks
- Accelerate threat detection and incident response by enriching network and application metadata with critical host and environmental context—reducing Mean-Time-To-Detect (MTTD) and Mean-Time-To-Respond (MTTR) across hybrid and multi-cloud workloads.

Figure 2. Dashboard allows granular selection of numerous metadata elements on a per app and protocol basis.

Application Metadata Intelligence (AMI) expands upon app layer visibility derived from Gigamon Application Visualization and Filtering and supports a comprehensive approach to obtain application behavior. Whether organizations deploy their workloads on-prem or in the cloud, they can acquire critical details pertaining to flows, reduce false positives by separating signals from noise, identify nefarious data extraction, and accelerate threat detection through proactive, real-time traffic monitoring as well as troubleshooting forensics.

SIEM solutions use this information to correlate and analyze log data from servers and security appliances. Network security and monitoring tools leverage AMI to deliver the insight and analytics needed to manage the opportunities and risks associated with a digital transformation. Administrators can automate detection of anomalies in the network, stop cyber risks that overcome perimeter or end-point protection, and identify bottlenecks and understand latency issues. AMI provides direct integration with observability tools such as Datadog, Dynatrace, Elastic, New Relic, and Sumo Logic via JSON and Kafka, allowing these observability tools to perform new security functions, such as identifying services, rogue activities, and weak crypto practices. AMI uses deep packet inspection to provide summarized and context-aware information about raw network packets based on Layers 4–7. It enables tools to measure performance, troubleshoot issues, spot security events, and improve effectiveness. Available on HC Series hardware and GigaVUE Cloud Suite<sup>™</sup> with GigaVUE V Series, AMI supplies network and security tools close to 6,000 metadata attributes that shed light on the application's performance, customer experience, and security. Gigamon extracts and appends elements to IPFIX, CEF, and JSON records over HTTP/S and Kafka that includes the following:

- Identification: Social media user, file and video names, and SQL requests
- HTTP: URL identification, command response codes levels
- DNS parameters: Multiple elements including request/response, queries, and device identifiers
- IMAP and SMTP email-based communications with sender and receiver addresses
- Service identification: Audio, video, chat, and file transfers for VoIP and messaging
- Customer/network awareness: VoIP (SIP, RTP) and mobile user/data plane sessions

**Figure 3.** AMI metadata visualized in Splunk. The dashboard provides insights into weak ciphers, cryptographic hash, TLS versions, compression algorithms, signature algorithms and key exchange protocols.

**Figure 4.** AMI metadata visualized in Splunk. The dashboard provides insights into Cryptomining activity.

Advanced L7 metadata can be used in a variety of use cases. The principal deployment for AMI is in providing metadata to SIEM tools for security analysis. Data exfiltration can be identified by the volume and type of DNS requests implying DNS tunneling and evaluating the legitimacy of the domains. Suspicious network activity can be investigated by detection of unauthorized remote connections, their bandwidth usage, and longevity of the connections as well as an unusual volume of SSH, RDP, or Telnet sessions. Time window analysis can be made by leveraging metadata to look at Kerberos, SMB, and HTTP use; by isolating their prior and post protocol activities that lead up to an incident, security breach origins can be found.

AMI can assist in identifying suspicious behavior. High-privilege user activity, particularly with logins from unauthorized systems or from multiple hosts, can suggest these user credentials have been compromised or a hacker is trying a brute force attack using the login ID of a privileged user. Analyzing HTTP client errors by looking at their occurrence relative to total response codes can reveal a brute force attack in progress.

Metadata can be used to evaluate network and application health using application broadcast and

multicast control packets. Applications send these packets at regular intervals, and by analyzing them over time, IT can determine the average interval between control packets and their timing during this period. A differential in interval time between control packets could be due to device malfunction, network congestion, or network traffic storms. AMI attributes involving SNMP, STP, UPNP, and any broadcast packets can be useful in pinpointing the root cause.

For mobile network data monetization use cases, GigaVUE® Enriched Metadata (GEM) for Mobile Networks harnesses the power of AMI with subscriber intelligence control plane metadata. Application metadata can be correlated and arranged in records based on key mobile network identifiers, such as user with subscriber, device, location, radio access network, network slice, and quality of service. This allows targeted analysis to be performed on user sessions that are more difficult to process due to the complexity of 3G/4G LTE and 5G core networks that use GTPv2 or HTTP/2 for the control plane and GTPv1 for tunneling the user traffic. For highbandwidth performance, AMI C-Tag distribution for GigaVUE HC Series platforms delivers a significant boost on GTP traffic, while TEID export and IPFIX multi-collect for GigaVUE HC Series platforms provide users more flexibility and visibility.

### AMI Pre-defined Use Case Templates

Security Posture Template helps to detect and remediate flaws in securing applications in the network.	<ul> <li>This includes:</li> <li>Certificates</li> <li>Versions</li> <li>Weak Cipher</li> <li>Key Exchange Protocols</li> </ul>	<ul> <li>Signature Algorithms</li> <li>Cryptographic Hashes</li> <li>Compression Algorithms</li> </ul>
Anomalous Traffic Template helps to detect and remediate challenges with HTTP, HTTPs, and DNS traffic for organizations.	This includes: • DNS • Shadow IT	• HTTPS/Web Traffic
Troubleshooting Template helps detect and remediate network delay, connectivity, and protocol errors in the network.	<ul><li>This includes:</li><li>Server vs Network Latency Issues</li><li>TCP/IP Connectivity Issues</li></ul>	<ul><li>DNS Server Failures</li><li>SIP Protocol Errors</li></ul>
Suspicious Activities Template helps detect and remediate issues related to unmanaged devices, suspicious connections, and traffic outside norms in the network.	This includes: • IoT Unmanaged Devices • Suspicious Connections • Traffic Outside Norms	
Rogue Activities Template helps detect and remediate unsanctioned applications that can pose challenges to your network and security.	This includes: • P2P • Crypto Jacking	
M-21-31 Logging Template helps certain federal use cases with U.S. Office of Management and Budget M-21-31 logging requirements.	This includes: • HTTPS and PKI Traffic Details • DNS Information • Shadow IT	<ul> <li>IoMT Protocol Activity</li> <li>OT Monitoring</li> <li>Web Traffic Details</li> </ul>

Figure 5. AMI metadata visualized in Splunk.

Application identification	AMI works in concert with Gigamon Application Visualization to determine applications in use, in turn, <b>multiple attributes are generated, such as:</b>				
Identification	<ul> <li>User of social media sessions</li> <li>SQL requests for database servers</li> </ul>				
	<ul> <li>Industrial control system metrics, including function codes, control flags, and data records</li> </ul>				
	Names of videos played in streaming me				
	SSL details	SSL Certificate	Subject Pub Algorithm		
	Valid Not Before	• Subject Pub Key Size			
	• Valid Not After	<ul> <li>Subject Alt Name</li> </ul>			
	• Serial Number	<ul> <li>Server Name Indication</li> </ul>			
	Signature Algorithm	Server Version			
НТТР	Detailed information on HTTP sessions in	ncluding:			
	<ul> <li>URL identification</li> <li>HTTP methods such as GET, POST, DELETE etc.</li> <li>All five HTTP response code levels viz., Informational, Successful, Redirection, and Client and Server errors</li> </ul>				
	• Version, User and Server agent, RTT and	content details			
DNS	DNS-related parameters, including:				
	Response name	• Op Codes			
	Response code	Response TTL			
	• Query name	ResponseIPv4Addr			
	Device identifiers	ResponselPv6Addr			
Service identification	• Audio, video	VoIP sessions			
	<ul> <li>Chat, instant messaging</li> </ul>	<ul> <li>APN/DNN (Mobile Networks Only)</li> </ul>			
	File transfers				
Video file	Obtain information to help measure cust	omer experience:			
	• Codec				
	• Bit rate in a Flash video				
	Video start/stop times				
	<ul> <li>Resolution levels (such as standard, high-definition) and changes</li> </ul>				

## Key Metadata Attributes

Device ID	Identify source or destination machine type:			
	• Port ID	Network Prefix Address		
	• TTL	Network Prefix Mask		
	• Platform	Interface Address		
	SW Version	Management Address		
	Native VLAN ID Capabilities	• IMEI/PEI (Mobile Networks On		
LLDP	Identify source or destination machine	type:		
	• Chassis IP	• VLAN Name		
	• Port ID	Port VLAN ID		
	• TTL	Management VLAN ID		
	Port Description	<ul> <li>Link Aggregation ID</li> </ul>		
	• System Name	<ul> <li>Link Aggregation Status</li> </ul>		
	System Description	• MTU		
	Management Address			
	Capabilities Available			
	Capabilities Enabled			
		source and destination caller information		
SIP	Sender and receiver information to get			
SIP	Sender and receiver information to get in addition to IP addresses for a SIP call

	<ul> <li>in addition to IP addresses for a SIP calls</li> <li>INVITE</li> <li>ACK</li> <li>BYE</li> </ul> Attributes available to correlate SQL que <ul> <li>Authentication type</li> <li>User's login and password strings</li> <li>Protocol version</li> </ul>	• REGISTER • OPTIONS • CANCEL request types		
	<ul> <li>in addition to IP addresses for a SIP calls</li> <li>INVITE</li> <li>ACK</li> <li>BYE</li> </ul> Attributes available to correlate SQL que <ul> <li>Authentication type</li> <li>User's login and password strings</li> <li>Protocol version</li> <li>Error codes</li> </ul>	: • REGISTER • OPTIONS • CANCEL request types eries with query parameter values includ		
	<ul> <li>in addition to IP addresses for a SIP calls</li> <li>INVITE</li> <li>ACK</li> <li>BYE</li> </ul> Attributes available to correlate SQL quases of the second strings <ul> <li>Authentication type</li> <li>User's login and password strings</li> <li>Protocol version</li> <li>Error codes</li> <li>SQL queries</li> </ul>	: • REGISTER • OPTIONS • CANCEL request types eries with query parameter values includ		
SIP Object-relational database	<ul> <li>in addition to IP addresses for a SIP calls</li> <li>INVITE</li> <li>ACK</li> <li>BYE</li> </ul> Attributes available to correlate SQL question type <ul> <li>User's login and password strings</li> <li>Protocol version</li> <li>Error codes</li> <li>SQL queries</li> <li>Bind variables, format (text/binary) with</li> </ul>	: • REGISTER • OPTIONS • CANCEL request types eries with query parameter values includ		

### Key Metadata Attributes, cont'd

SCADA applications and Industrial Control Systems	Securing and modernizing IT and OT (operational technologies) in critical infrastructure industries: <ul> <li>Modbus: Over 30 attributes such as Modbus request and function codes</li> </ul>	
	Data record	
	DNP3 (Distributed Network Protocol) function code, control flags	
4G and 5G Core Networks	Analyzing user sessions within mobile core networks:	
	Subscriber ID	
	Device ID	
	• Cell ID	
	<ul> <li>Over-the-top Application: ID, Name, URL, family</li> </ul>	
	<ul> <li>Flow: ID, Start and End, Last Packet, Src and Dest IP, Src and Dest Port, Protocol, Src and Dest Octets and Packets</li> </ul>	
	GTP session: TEID, outer Src and Dest IP	
	• QoS ID	
	Tracking Area IDs	
	Country Code	
	Carrier ID	
	PDN address	

### Key Metadata Attributes, cont'd

### **Example Applications and Protocols**

Application	Protocol
ActiveSync	AMQP
Adobe	ARP
Amazon	BGP
AOL Instant Messaging	CDP (Cisco Discovery Protocol)
Apple	СНАР
Bit Torrent	CIP
Facebook	DCE/RPC
Gmail	DHCP
Google	Diameter
Hotmail	DIMP
Jabber	DNP3
Line	DNS
LinkedIn	FTP
Modbus	Gnutella
MongoDB	GTP
MySQL	H225/248
Outlook Web Access	HTTP2/Proxy
Postgres	ICMP
Pronto	ΙΜΑΡ
Twitter	IP4/6
WhatsApp	POP
Yahoo	Radius
Yahoo Mail	SIP
YouTube	SMTP
Zimbra	SSL

### **Ordering Information**

Requirement	Description
GigaVUE-FM fabric manager	Single-pane-of-glass management and monitoring of all the physical and virtual nodes across your on-premises, virtual, and public cloud deployments, with simplified workflows for traffic policy configuration, end-to-end topology visualization, hierarchical grouping based on location, and customizable dashboards. Available as a hardware or a software-only virtual appliance, each GigaVUE-FM instance can manage hundreds of visibility nodes across multiple locations, including multi- cloud deployments.
<b>GigaVUE Intelligent Appliances:</b> GigaVUE-HCT, GigaVUE-HC1, GigaVUE-HC1-Plus, or GigaVUE-HC3 and GigaVUE Cloud Suite for cloud and virtual environments	GigaVUE Intelligent Appliances deliver consistent insight into data that travels across your network, including data centers, cloud, and remote sites. With the Gigamon solution, you will have the coverage and control you need to safeguard critical network and business assets.

#### **Support and Services**

Gigamon offers a range of support and maintenance services. For details regarding Gigamon Limited Warranty and its Product Support and Software Maintenance Programs, visit gigamon.com/support-and-services/overview-and-benefits.

#### About Gigamon

Gigamon<sup>®</sup> offers a deep observability pipeline that efficiently delivers network-derived telemetry to cloud, security, and observability tools. This helps eliminate security blind spots and reduce tool costs, enabling you to better secure and manage your hybrid cloud infrastructure. Gigamon has served more than 4,000 customers worldwide, including over 80 percent of Fortune 100 enterprises, 9 of the 10 largest mobile network providers, and hundreds of governments and educational organizations. To learn more, please visit gigamon.com.
