

## Case Study

# Leading U.S. Telecommunications Provider Enhances Security Posture While Reducing Tool Costs by 75 Percent with the GigaSECURE Security Delivery Platform

“For us, the Gigamon solution was an absolute necessity in securing our infrastructure and containing costs.”

–Network planner at a leading telecommunications provider

### Customer Benefits

- Decreased tool costs by 75 percent
- Simplified infrastructure by reducing 24 DDoS tools to six
- Gained the ability to deploy multiple security tools inline
- Customized negative heartbeat to determine proper tool performance

### Gigamon Solution

GigaSECURE® Security Delivery Platform with:

- GigaVUE-HC2 Series visibility nodes with Inline Bypass
- GigaVUE TA Series edge traffic aggregation nodes
- GigaSMART® traffic intelligence modules with NetFlow/Metadata Generation, Application Session Filtering

### Challenges

When a leading U.S. telecommunications provider began to redesign its network infrastructure from the ground up, its first thought was security.

“Security should never be an afterthought,” said one of the company’s network planners, who is responsible for network tapping and security tool optimization. “For us, good security starts with having complete visibility into our network traffic and so, we knew we needed a solution that would allow us to see all traffic across the network.”

The company’s top priority was finding a solution that could support NetFlow generation, especially to help the security operations (SecOps) team with triage in the event of an attack. Additionally, the network operations (NetOps) team wanted a solution that offered advanced session filtering capabilities to help future-proof the infrastructure for subsequent requirements or tool additions.

### Solution

“We’re like family, NetOps and SecOps; and we work collectively to determine the optimal solutions for the best overall architecture,” said the network planner. “You could say I learned about Gigamon through osmosis. The security team I used to belong to has a trusted relationship with Gigamon and had successfully rolled out Gigamon solutions to help with intrusion detection in our video hub offices. By all accounts, Gigamon seemed like a perfect match for our network upgrade.”

While the company looked at several vendors, it found that only Gigamon could support the requisite NetFlow generation capabilities with its GigaSECURE® Security Delivery Platform. Moreover, GigaSECURE offers additional traffic intelligence features like Application Session Filtering – to improve tool efficiency and limit performance degradation, and Inline Bypass – to maximize network and security resiliency by detecting failure of an active tool and redirecting traffic to a standby tool.

“My team was excited about the concept of a customized negative heartbeat, and Gigamon was the only vendor to help us create this for our distributed denial of services (DDoS) devices,” said the network planner. “In conjunction with the regular heartbeat, we are now able to send our DDoS tools a negative heartbeat packet that they should drop. If this packet is returned – or in fact, if the tools respond to that physical-layer heartbeat at all – we know the tools are not functioning properly or consuming the necessary traffic, allowing us to troubleshoot quickly to mitigate security risks.”

## Results

“If you’re in the process of building or upgrading a network, you need to ensure visibility into network traffic to help prevent attacks and ensure proper network operations. So, before you do anything else, get Gigamon – and get the access to and control of data you need,” said the network planner. “For us, the Gigamon solution was an absolute necessity in securing our infrastructure and containing costs.”

Today, the GigaVUE-HC2® Series sits inline between the provider networks and the underlying compute and storage architecture. All traffic passes through the GigaVUE-HC2, where it can be redirected to the company’s DDoS tool. After scrubbing malicious packets, the DDoS tool then sends sanitized traffic to an open source cloud platform. Thus far, the company has been able to decrease the number of DDoS security appliances and reduce costs by 75 percent.

“While our most immediate requirement was to support SecOps – and feed the right traffic to the right security monitoring tools – we realized that with GigaVUE-HC2 sitting on the network, we could also provide other service assurance and operations teams with visibility into network traffic,” said the network planner. “In the future, we hope to see even greater efficiency gains thanks to the Gigamon solution.”

## About Gigamon

Gigamon is the company leading the convergence of networking and security operations to help organizations reduce complexity and increase efficiency of their security stack. The company’s GigaSECURE Security Delivery Platform is a next generation network packet broker that helps customers makes threats more visible – across cloud, hybrid and on-premises environments, deploy resources faster and maximize the performance of their security tools. Global 2000 companies and government agencies rely on Gigamon solutions to stop tool sprawl and save costs. Learn how you can make your infrastructure more resilient, more agile and more secure at [www.gigamon.com](http://www.gigamon.com), on [our blog](#) and [Twitter](#), [LinkedIn](#) and [Facebook](#).
